

Progress Report

- Increment 2 -

Group #28

1) Team Members

Name	FSU ID	GitHub ID
Brooklyn Abrams	baa22	brooklynabrams
Carly Collins	crc22b	carlycollins
Tomas Caruso	Tac23c	Tomasca2
Philip Quattrochi	pnq22	ffilay
Brandon Mealey	bcm22c	bmealey8519

2) Project Title and Description

Byte2Bite- a restaurant inventory management software specifically tailored to Square point of sale. It links every sale processed through Square to the exact ingredients used. This allows restaurant managers to have real time inventory of their ingredients and also provide an accurate cost of goods sold. This together minimizes waste, decreases shortages, increases cost visibility, and maximizes profits.

3) Accomplishments and overall project status during this increment

Front End

- Login / Sign up page
- Ingredients Inventory
 - Add, Edit, Delete with modals for form completion
 - Continue developing the design with popups/modals for improved user interaction. Add functionality that allows users to include more detailed features or attributes for each ingredient.
 - Search and filtering abilities
- Menu Items page
 - Square used to fetch menu items
- Access to Database
 - Create typescript service files to access the database from the frontend
 - Supabase auth used for login

Back End

- Implement full CRUD (Create, Read, Update, Delete) operations for ingredients. Ensure CRUD operations are fully integrated and tested with the database.

Overall Integration

- Connect the back end ingredient functionality with the Square API. Verify that data flows correctly between the front end, back end, and external API.

4) Challenges, changes in the plan and scope of the project and things that went wrong during this increment

- AWS shutting down affected the supabase client.
- Pulling the menu items from the mock square api
- Having members feel confident in GitHub

5) Team Member Contribution for this increment

Brooklyn Abrams

- Pulled menu items from our mock square API
- Made menu items table to match ingredients table

Carly Collins

- Created login and create account page in the front end
- Used Supabase auth to create login endpoints in the backend

Phillip Quattrochi

- Ingredient search and column filtering
- Ingredient UI improvements
- Standardized ingredients to dropdown picker
- Ingredient stock cell color flags
- Menu items UI improvements

Brandon Mealey

- Worked on the requirements and design documentation
 - Designed the diagrams and use cases

Tomas Caruso

- Worked on the requirements and design document
- Working on improving login page
- Adding other UI pages currently

6) Plans for the next increment

- Link menu items to ingredients
- Make dashboard
- Make login page prettier
- Square transactions page
- New password that does not meet criteria (bug)
- Menu item variations make show up in items list
- Ensure security of pages

7) Stakeholder Communication

Dear Stakeholders,

I hope this message finds you well. I am pleased to share our latest update on Byte2Bite (B2B), our restaurant inventory management platform built to integrate seamlessly with Square's point-of-sale system.

During this increment, our team made significant progress across both the front and back end of the application. On the front end, we focused on enhancing the user experience by adding popups and modals to improve interaction and allow users to add more detailed attributes for each ingredient. We also developed new TypeScript service files to enable direct database access from the client side. On the back end, we successfully implemented full CRUD (Create, Read, Update, Delete) functionality for ingredients and integrated these operations with the database to ensure consistent and reliable performance.

We also advanced the overall integration process by beginning to connect our ingredient functionality with the Square API. This step is critical to achieving our goal of linking each sale to its corresponding ingredients in real time.

Despite this progress, the team faced several challenges. AWS downtime temporarily affected our Supabase client, delaying some data testing. Additionally, integrating menu items from our mock Square API required extra effort to align data structures. On the process side, ensuring all members were comfortable with GitHub workflows was a learning curve but ultimately improved our collaboration and version control practices.

Looking ahead to our next increment, our goals include, linking menu items directly to their corresponding ingredients, developing a central dashboard for managers, enhancing the login page's design and user experience, building a Square transactions page, addressing menu item variation displays, and refining password validation to meet updated criteria.

Our overarching mission remains clear: to provide restaurant managers with a platform that connects every sale to the exact ingredients used, delivering real-time inventory insight, accurate cost-of-goods tracking, and reduced waste, all at a fraction of the cost of existing platforms like MarketMan.

Thank you for your continued support as we move closer to a fully integrated and functional system.

Best regards,
The Byte2Bite Team
