

Progress Report

- Increment 3-

Group #28

1) Team Members

Name	FSU ID	GitHub ID
Brooklyn Abrams	baa22	brooklynabrams
Carly Collins	crc22b	carlycollins
Tomas Caruso	Tac23c	Tomasca2
Philip Quattrochi	pnq22	ffilay
Brandon Mealey	bcm22c	bmealey8519

2) Project Title and Description

Byte2Bite- a restaurant inventory management software specifically tailored to Square point of sale. It links every sale processed through Square to the exact ingredients used. This allows restaurant managers to have real time inventory of their ingredients and also provide an accurate cost of goods sold. This together minimizes waste, decreases shortages, increases cost visibility, and maximizes profits.

3) Accomplishments and overall project status during this increment

Front End

- Login / Sign up page
 - Make dashboard
 - Make login page prettier
 - Create account page
 - Email verification page
 - Forgot password page
- Ingredients Inventory
 - Add, Edit, Delete with modals for form completion
 - Continue developing the design with popups/modals for improved user interaction. Add functionality that allows users to include more detailed features or attributes for each ingredient.
 - Search and filtering abilities
 - Link menu items to ingredients
 - Square transactions page
- Menu Items page
 - Square used to fetch menu items -
 - Menu item variations make show up in items list
- Access to Database
 - Create typescript service files to access the database from the frontend
 - Supabase auth used for login

Back End

- Implement full CRUD (Create, Read, Update, Delete) operations for ingredients. Ensure CRUD operations are fully integrated and tested with the database.

Overall Integration

- Connect the back end ingredient functionality with the Square API. Verify that data flows correctly between the front end, back end, and external API.

4) **Challenges, changes in the plan and scope of the project and things that went wrong during this increment**

- AWS shutting down affected the supabase client.
- Pulling the menu items from the mock square api
- Having members feel confident in GitHub

5) **Team Member Contribution for this increment**

Brooklyn Abrams

- Pulled menu items from our mock square API
- Made menu items table to match ingredients table
- Worked on dashboard page

Carly Collins

- Created login, create account, verify email, and forgot password page in the front end
- Used Supabase auth to create endpoints for each table in the database in the backend

Phillip Quattrochi

- Ingredient search and column filtering
- Ingredient UI improvements
- Standardized ingredients to dropdown picker
- Ingredient stock cell color flags
- Menu items UI improvements
- Square Transactions page

Brandon Mealey

- Worked on the requirements and design documentation
 - Designed the diagrams and use cases
- Tested backend code thoroughly

Tomas Caruso

- Worked on the progress report document
- Worked on improving login page
- Tested frontend code thoroughly

6) **Plans for the next increment**

- Keep updated with minimal bugs

7) Stakeholder Communication

Dear Stakeholders,

I hope this message finds you well. We are excited to share that Byte2Bite (B2B) has now reached full project completion. What began as a concept for smarter restaurant inventory management has evolved into a fully built, integrated, and market ready platform designed to work seamlessly with Square's point of sale system.

At this stage, Byte2Bite is no longer in development. It is a complete and functional product. Core features across the front end, back end, and database are fully implemented, including ingredient level inventory tracking, CRUD operations, authentication, dashboards, menu item management, and Square API integration. Together, these components enable our defining capability, connecting every sale to the exact ingredients used in real time and delivering accurate inventory levels and cost of goods visibility.

With development complete, our focus now shifts toward deployment, adoption, and growth. The next logical step for Byte2Bite is implementation within real restaurant environments, where the platform can immediately begin delivering value. As restaurants come onboard, the platform's impact and market value will continue to increase through real usage, customer feedback, and scalability. This positions Byte2Bite as a ready to purchase solution, not a prototype, and one that can compete strongly with higher-cost platforms currently on the market.

Byte2Bite's value proposition is clear and compelling. Restaurant managers gain real-time insight into inventory, reduced waste, improved purchasing decisions, and transparent cost tracking, all at a fraction of the cost of existing enterprise solutions. As adoption grows, so does the strength of the product, its data, and its long-term potential.

We appreciate your continued support throughout the development process and are proud to present Byte2Bite as a completed, deployable product ready for real-world implementation and continued growth.

Best regards,
The Byte2Bite Team
